Sunflower

Sunflowers belong to the Asteraceae family, native to North America. Sunflowers are composite flowers - the large flower head is actually made up of hundreds and thousands of small flowers.

Sunflowers not only resemble the sun with petals in warm shades of yellow and orange, they also come in deep red and even purple.

With most sunflowers growing up to 4m high with flower heads spanning 40cm, they are popularly known as "tall giants".

There are dwarf sunflowers shorter than 90cm with flower heads spanning 15cm.
